## CRAFTSMANSHIP

It may be 'just' pliers—but it's pliers!

Tradition and innovation of FUJIYA, which has continued for more than 90 years  
 With our skilled technology, we will continue to be committed to quality above all else.

### Forging

The air gaps inside the metal are crushed, to enhance the strength and form the metal into the intended shape. This is the most important process that decides the quality of the product. By the fine-tuned checking of product quality, if there are products with poor quality, we immediately stop production to prevent poor-quality products from being sent to the next stage of the process. Additionally, when there are requests from the post-process, we always improve the forging to meet such requests.

### Machining process

First, the metal is machined to make it closer to the shape of a final product. You might think it's 'nothing but pliers'. But we do process the metal, using many machines, to make a single pair of pincers. We make proper adjustments of individual machines, committing ourselves to making only the highest-quality products.

### Assembly

After combining the right and left parts by inserting a pin, the operator manually makes adjustments. For the first time, the metal is formed into a pair of pliers. In this process, the left and right parts, sent separately from the machining process, are assembled into a single item. Since this process is the groundwork for the post-process, the operator checks each pair of pliers, individually, to make sure there is absolutely zero mis-alignment when the left and right parts are assembled, making delicate adjustments, if necessary.

### Quenching

After quenching the entire part, the operator applies high-frequency induction quenching to increase the hardness of the tips. The operator applies quenching equally to the left and right blades to increase the hardness, in order to produce highly durable blades of equal hardness. However, if the metal is too hard, it becomes rather brittle. Therefore, we check the products with rigorous standards, by conducting tests on body hardness, blade hardness and impact resistance.

### Edge sharpening

If the edges of right and left blades hit each other accurately, their durability becomes inferior, while if they are overlapped too much, the sharpness becomes inferior. This process decides the cutting sharpness, which is the most important for all types of pliers. The bottom ends of the blades are used for cutting, in the case of side cutting pliers, while the top ends of the blades are used for cutting, in the case of nippers. Therefore, the operator manually sharpens the edges of blades, one by one, by thinking about how the products will actually be used. In addition, since durability depends on how the edges are sharpened, the operator conducts the edge sharpening operation by being conscious, not only of its sharpness, but also its durability.

### Polishing

In this finishing process, the products are carefully polished. This process is not directly related to the function of the product. However, if a product has a poor appearance, customers will be reluctant to pick them up from the shop counter. Therefore, we carefully polish our products by paying full attention to appearance, including the balance between the left and right parts, uniformity among each product and offer beautifully polished surfaces.

# FUJIYA FACTORY

## World wide

Fujiya has established a global supply system that comes from its three production facilities in Osaka, Japan, Niigata, Japan, and Fujiya Vietnam. We work hard to meet our customer's needs.

## Headquarters & OSAKA Factory

The head production facility in Osaka is our machining center which focuses on product and technological development. We work on creating cutting edge tools through highly precise processing technology and our uniquely developed quenching process which involves laser heat treatment.

## VIETNAM Factory

At Fujiya Vietnam, the same high-quality products from Japan are produced under the careful watch of skilled workers who underwent training in Japan.

## NIIGATA Factory(WISE)

The Niigata production facility focuses on the production of ballpoint wrenches and screwdrivers which feature excellent rigidity and durability. These features are created via our uniquely developed heat treatment method.

## PICTOGRAM

### Strong Style

**STRONG BLADES**  
Blades are at an obtuse angle and last exceptionally well.

### Flat Type

**STRAIGHT BLADES**  
Best for curved gate cuts.

**ROUND BLADES**  
Suitable for flat gate cuts.

**MICRO MIRROR BLADE**  
These blades feature Fujiya's own "Micro Mirror Blade" which was developed through polishing technology. They allow for simple cuts, and leave a beautiful cut cross section.

**STANDARD MODEL**  
A popular standard model loved by many of our customers.

**with SPRING MODEL**  
The spring makes these suitable for work involving repeated cutting.

**ROHS COMPLIANT**  
This item is ROHS approved.

**ELASTOMER GRIP HANDLE**  
Use an elastomer resin grip that is both gentle on the environment and fits perfectly in one's hand.

**SAFETY APPLICABLE**  
Comes with a hole in the grip for attaching to a safety cord.

**WIDTH of BLADE**  
Displays the blade width.

**STAINLESS PRODUCT**  
Made with stainless steel and is rust-resistant.

**ALUMINUM**  
Made stronger and lighter with an aluminum body and so the user doesn't tire out.

**EASY CUTTING**  
Items are easier-to-cut with diagonal blades and by placing the rivet at point A.

**SMALLHOLE on BLADES**  
Comes with stripping function for covered wires.

**CRIMPING FUNCTION**  
Equipped with a convenient, simple crimping function that's helpful on worksites.

**PLIER FUNCTION**  
There is a large indentation at the base of the jaws, leading the tool to function as pliers, too.

**ESD APPLICABLE**  
The grips reduce static electricity for short periods of time and resist electrocution.

**CUTTING FUNCTION**  
Comes with cutting function.

**SOFT GRIP HANDLE**  
This grip design was created via ergonomics. It's soft, able to be used for long periods of time, and reduces stress on hand when in use.

**with INDENTATION**  
Jaws are indented in order to assure that gripped items will not slip.

**without INDENTATION**  
Jaws are flat in order to not damage anything gripped.

**STOPPER FUNCTION**  
Comes with easy-to-use safety stopper and is secure when stored.

**BENT TYPE**  
The nose is bent, making it more user-friendly.

**CLIPPER**  
Blades are clipper-type.

**DETACHABLE CLAW TYPE**  
Claw can be detached from the main body with one screw.

**MICRO EDGE**  
The base of the jaws are indented in order to help secure the item being cut.

**WIRE CUT FUNCTION**  
(Annealing) wires up to 2mm in diameter (max #14) can be cut with these. Tools with this icon can also cut up to three #18 (1.2mm diameter) wires at once.

**NON SCATTERING DEVICE**  
Coated with a non-scattering plate so no fragments scatter when cut.

**EXCLUSIVE TOOL**  
This item is Exclusive tool.

**NEW INDENTATION SHAPE**  
Jaws hold a better grip than their original counterparts.

**DETACHABLE BLADE TYPE**  
If the blade becomes dull, then it can be replaced with a new one to make it like-new.

**JIS JQA**
