OMRON

Motor Condition Monitoring Device
K6CM

Quantifying the status of a three-phase induction motor and pump.

The alarm output threshold default is set. You can customize the value according to the site.

As for comprehensive current diagnosis, the degradation can be detected comprehensively by combining each motor part and the load side.

The insulation resistance of the three-phase induction motor and pump can be measured with current flowing (the secondary side leakage current of the inverter can also be detected).

✽ZCT (IRT) is compatible with UL Recognition

For the most recent information on models that have been certified for safety standards, refer to your OMRON website.

Features

- Since the condition of the motor can be displayed in numeric values on the LCD, the motor condition can be checked without a dedicated tool.
- The alarm output settings can be made according to the device, with reference to the threshold value that has already been set by default.
- Depending on the threshold value setting for alarm output, the condition of the motor can be displayed on an alarm bar in three colors; Green (normal), Yellow (warning), and Red (critical).
- Equipped with a transistor output that externally outputs the status of the motor and error states of the K6CM main unit.
- Monitoring can be performed easily on the PC by EtherNet/IP communication and a dedicated tool.
- The numeric values of vibrations, temperature, insulation resistance, and current can be monitored by the same dedicated tool.
- The trend of the motor condition can be monitored by a dedicated tool, and thus indications of a degradation can be monitored.
- Clamp-type CT/ZCT that supports easy post installation. With a clamp-type CT/ZCT, the device can be installed without changing or removing the existing wiring, which makes post-installation easy.
- Comes with the self-diagnosis function of the main unit internal circuit and analog sensing circuit.
- Push-in Plus Terminal Technology reduces wiring work (double-insertion holes for crossover wiring).
- UL listed for easy shipping to North America (ZCT (IRT) is UL recognized).

System Configuration

## Basic Configuration

Vibration & temperature type (K6CM-VB)

Inverter *1

Three-phase power supply

2.6 m (pre-wired cable)

K6CM-VBS1 (pre-amplifier)

Connector

0.3 m

Single-phase power supply

1 m (extendable to 100 m) (pre-wired cable)

Tighten screw perpendicularly directly above rotation shaft (load side)

K6CM-VBS1 (Sensor head)

Measurement trigger signal

Output signal (transistor output)

Object monitored

K6CM-VBM

Built-in EtherNet/IP port

By keeping a computer or PLC continuously connected, you can monitor the state of a motor.

Dedicated tool

EtherNet/IP

LAN

∗1. Using an inverter helps prevent motor deterioration.
In the conditions below, acceleration fluctuations tend to occur more frequently.
- The frequency is stable at an inverter drive frequency of 50 Hz or higher.
- The inverter carrier frequency is stable at 12.5 KHz or higher.

Test in the actual installation environment before use.

Note: Even without a computer, the alarm bar of the main unit notifies you of changes of motor state.

Insulation resistance type (K6CM-IS)
Three-phase, three-conductor, S-phase ground

Inverter

(Measurement is also possible without an inverter)

Inverter secondary-side voltage

40 m max. (From ZCT to motor. Extendable in some conditions) *2

Three-phase power supply

R
S
T

1 m

(pre-wired cable)

K6CM-ISZBI52

Object monitored

Single-phase power supply

Measurement trigger signal

1 m (extendable to 100 m) (pre-wired cable)

7.5 kW or less (Measurement error increases when this value is exceeded.)

By keeping a computer or PLC continuously connected, you can monitor the state of a motor.

Dedicated tool

K6CM-ISM

Output signal (transistor output)

Built-in EtherNet/IP port

EtherNet/IP

LAN

Note: Even without a computer, the alarm bar of the main unit notifies you of changes of motor state.

OMRON

Three-phase, four-conductor, N-phase ground

Note: When an inverter is used with three-phase, four-conductor, N-phase ground, correct measurement is not possible

R

K6CM-CIM

Object monitored

1.5 kW to 300 kW (400 V)
0.75 kW to 150 kW (200 V)

Output signal (transistor output)

Built-in EtherNet/IP port

By keeping a computer or PLC continuously connected, you can monitor the state of a motor.

Dedicated tool

EtherNet/IP

LAN

∗2. When an inverter is used to drive a motor, the level of degradation may not be uniform. In that event, vary the inverter drive frequency.
The level of degradation may be greater then when driven with a commercial power supply. Adjust the alarm threshold appropriately for the motor drive method. Always measure and monitor the level of degradation using the same inverter drive frequency.

Note : 1. Even without a computer, the alarm bar of the main unit notifies you of changes of motor state.
2. The degradation level may appear differently depending on the failure condition of the motor or load, or depending on the installation condition.

K6CM

Ordering Information

List of Models

Monitoring type	Power supply voltage	Model
Vibration & temperature type	100 to 240 VAC	**K6CM-VBMA-EIP**
	24 VAC/VDC	**K6CM-VBMD-EIP**
Insulation resistance type	100 to 240 VAC	**K6CM-ISMA-EIP**
	24 VAC/VDC	**K6CM-ISMD-EIP**
Comprehensive current diagnosis type	100 to 240 VAC	**K6CM-CIMA-EIP**
	24 VAC/VDC	**K6CM-CIMD-EIP**

Input part
Vibration & temperature sensor (Order separately)

Appearance (pre-amplifier)	Appearance (sensor head)	Attachment part	Applicable Relay	Model
		M6 screw	K6CM-VBM	**K6CM-VBS1**

Note: The vibration and temperature sensor consists of a sensor head and a pre-amplifier.
A magnet is provided for the easy attachment of the vibration and temperature sensor.

ZCT (IRT) (Order separately)

Rated voltage	Through hole dia. (mm)	Applicable Relay	Model
200 to 480 VAC	52 dia.	K6CM-ISM	**K6CM-ISZBI52**

Note: ZCT (IRT) is the abbreviation for Zero Current Transfer (Insulation Resistance Transfer).
A cable for connection is provided with the ZCT (IRT).

CT (Order separately)

Rated primary-side current	Applicable Relay	Model
5 A	K6CM-CIM	**K6CM-CICB005**
25 A		**K6CM-CICB025**
100 A		**K6CM-CICB100**
200 A		**K6CM-CICB200**
400 A		**K6CM-CICB400**
600 A		**K6CM-CICB600**

Note: A cable for connection is provided with the CT. Select a CT that sets the current of the applicable motor within the measurement range.
To calculate the current, refer to *Comprehensive Current Diagnosis Type Technical Data (Reference)* on page 17.

OMRON

EtherNet/IP communication cable recommended parts

Use a Category 5 or higher STP cable (shielded twisted pair cable).

Cable with Connectors

Item		Recommended manufacturer	Cable length (m)	Model
Wire Gauge and Number of Pairs: AWG26, 4-pair Cable Cable Sheath material: LSZH ∗2	Cable with Connectors on Both Ends (RJ45/RJ45) Standard RJ45 plug type ∗1 Cable color: Yellow ∗3	OMRON	0.3	XS6W-6LSZH8SS30CM-Y
			0.5	XS6W-6LSZH8SS50CM-Y
			1	XS6W-6LSZH8SS100CM-Y
			2	XS6W-6LSZH8SS200CM-Y
			3	XS6W-6LSZH8SS300CM-Y
			5	XS6W-6LSZH8SS500CM-Y
Wire Gauge and Number of Pairs: AWG22, 2-pair Cable	Cable with Connectors on Both Ends (RJ45/RJ45) Rugged RJ45 plug type ∗1 Cable color: Light blue	OMRON	0.3	XS5W-T421-AMD-K

*1. Select a CT that brings the current of the applicable motor into the measurement range.
    To calculate the current, refer to the technical data on page 18.
*2. When using a flat wire, be sure to refer to the external dimensions drawing of the CT before selection on page 15.

Motor condition monitoring Tool (Software included with main unit)
Operating Environment

Element	Specification
Supported OS	Windows 7, Windows 8.1, Windows 10 (32 bit/64 bit) (Japanese/English)
.NET	.NET Framework 4 and .NET Framework 3.5
CPU	1 GHz or more, 32 bit or 64 bit processor
Memory	1 GB or more, or 2 GB or more (for 64 bit)
HDD	Available space of 16 GB or more, or 20 GB or more (for 64 bit)
Others	Since this software is provided on a CD-ROM, a CD-ROM reading device must be available. If data is to be collected, a LAN I/F must be available.

Functions/Specifications (For more details, refer to the catalog of each product.)

Item		Specification
Project	**Number of files that can be created**	No limit
Log file		CSV data format
Monitoring cycle		5 second to 99999 second (one-second step)
Number that can be registered in one project	**Number of motors (device groups)**	10
	Number of devices per motor (device group)	3 ✽
Graphic display	**Type of graph**	Line graph
	Display period	1 hour, 1 day, 1 month, 3 months, 6 months, 1 year, 2 years, 5 years, 10 years, 20 years

✽ One vibration and temperature type, one insulation resistance type, and one current comprehensive diagnosis type can be set for one motor.

Nomenclature

Name		Meaning

Alarm bar		A bar on which the color of the emitted light changes according to the alarm status.	It is indicated in the following colors during measurement/monitoring.
			  Green: Alarm status (normal)
			  Yellow: Alarm status (Warning)
			  Red: Alarm status (Critical)
			The alarm bar is lit out in each of the following states:
			  When the power is OFF, when measurement is not being performed, and when a self-diagnosis error has occurred, etc.

Measurement type		Indicates the type of the measured value being displayed. The type can be switched each time the [DISP] key is pressed on the front operation part.	K6CM-VB "G": Acceleration, "mm/s": Velocity, "T"; Motor temperature, "⊿T": Temperature Gap (difference between motor temperature and room temperature) K6CM-IS "MΩ": Insulation resistance, "mA": Leakage current K6CM-CI "Cim": Degradation level, "A": Current
Front operation part	[ALM RST] key	Releases the latched alarm state.	The main use of this key is to release the latched and fixed alarm state after returning from the fault state to the normal state.
	[DISP] key	Switches the type of the measured value being displayed.	
	Others	If two keys are simultaneously pressed and held for 5 seconds or longer, all settings of the main unit are reset to factory defaults.	
Main unit status display		The status of the main unit is indicated by lighting of the LCD characters.	"MON": Measurement / monitoring is being performed "ERR": A self-diagnosis error has occurred "AGE": Running Time notification (it is recommended to replace the product main unit)

Transistor output	13-14	Output of the alarm status (Warning). Can be set to Normally Closed or Normally Open.	When measurement/monitoring is in progress,
			and the output method is Normally Closed
			  ON = Comprehensive alarm: Normal / OFF = Comprehensive alarm: Warning or Critical
			and the output method is Normally Open
			  OFF = Comprehensive alarm: Normal / ON = Comprehensive alarm: Warning or Critical

	15-16	Output of the alarm status (Critical). Can be set to Normally Closed or Normally Open.	When measurement/monitoring is in progress,
			and the output method is Normally Closed
			  ON = Comprehensive alarm: Warning or Normal / OFF = Comprehensive alarm: Critical
			and the output method is Normally Open
			  OFF = Comprehensive alarm: Warning or Normal / ON = Comprehensive alarm: Critical

	17-18	Self-diagnosis error output.	OFF: A self-diagnosis error has occurred ON: Other than the above
External trigger input	3-4	Input of the external contact signal to control measurement timing.	You can use "Trigger Type" to specify whether measurement/monitoring continue for a set time after starting by the rise or fall of the external contact, or are executed while the external contact is ON. You can also specify settings to enable selection of a trigger mode other than external trigger. ✽

Note: Warning: Indicates that it is time for maintenance.
      Critical: Indicates that it is time for replacement.
✽ Trigger modes other than external trigger
  Always: Trigger is not used. Measurement/monitoring are performed continuously after the power of the K6CM unit is turned on.
  Internal trigger: Measurement/monitoring starts based on the relation between the measured value and set value (trigger level).
                  You can use "Trigger Type" to specify whether measurement/monitoring start and continue for a set time when the measured value is over, or under, the set value (trigger level), or are executed while the measured value exceeds the set value (trigger level).
  Also, the external trigger function can be used only when the insulation resistance type is EIP CPU version 1.1 or higher.

K6CM

Insulation Resistance Type Technical Data (Reference)

Method of measuring the value on the insulation resistance meter

Leakage current includes two types, namely capacitive leakage current (Ioc) that flows through the earth capacity, and resistive leakage current (Ior) that flows due to the degradation of wiring and devices, and is the cause of electric shock and fire. The leakage current is determined by detecting the value of the zero-phase current Io, which is the combined component of Ioc and Ior. (See the figure below)
About changes in the measurement accuracy

If there is almost no insulation deterioration in the motor, almost the entire constituent of Io becomes Ioc, and the measurement accuracy of Ior declines. Further, if the Ioc based on the motor-specific electrical capacitance is larger than Ior, then the measurement accuracy will similarly decline. Particularly, if the electrical capacitance increases in proportion to the capacitance of the motor, the measurement accuracy changes depending on the motor capacitance.

The following items are the possible parameters affecting the measurement accuracy.

Increase in Ioc ....Type of motor (manufacturer, structure), capacitance, number of poles, and the length of wire between ZCT (IRT) and the motor
Other noise components.......Through-current, through-position
External factors.....................Voltage imbalance

Capacitance	Low	High
No. of poles	Less	Many
Wire length	Short	Long
[Effect of residual current]

Another noise component is the residual current✳ (hereinafter, specified as Ir). Ir increases in proportion to the through-current.

✳ Residual current
Residual current refers to the error that occurs as a result of an imbalance in the magnetic flux of each phase inside the core due to the arrangement of the through-wire of ZCT.
Errors also occur as a result of the imbalance in the magnetic circuit of ZCT.

Ir combines with Io, and is output to the secondary side of ZCT. Ir is the same frequency component as Ior, and the amount of current or the phase difference with respect to Ior changes depending on the through-position of the power line passing through ZCT. Therefore, isolation from Ior, which must essentially be detected, becomes difficult.

If the position of ZCT and the through-wire is fixed once, the phase of Ir does not change. Moreover, by fixing the through-wire in the center of ZCT, Ir can be reduced. Fix and install the through-wire in the center as much as possible.

Use the following holder to fix the through-wire in the center of ZCT.

| Part name	Manufacturer	Model
Rubber holder	Midori Anzen Co. Ltd.	**HZ-25**

OMRON

Effect of voltage imbalance

The ZCT (IRT) calculates the Ior from the phase difference between the measured Io and the voltage. If there is a voltage imbalance, the phase of each phase voltage will change, and an error will occur in the calculation of Ior. Use the measurement results of the case when the voltage imbalance ratio is within 3%.

Range indicated by the measured value during insulation deterioration

The accuracy of the insulation resistance value is decided under the influence of several parameters. (The parameters are as described on page 16)
An example of the range shown by the measured value as a result of deterioration of the insulation resistance is shown in the figure below.
Ioc may further increase depending on the manufacturer and structure of the motor, which may result in a decline in accuracy.

Conditions
• Top runner of Company A
  (200-V type, 7.5 kW, 4 poles)
• Wiring length of ZCT and motor: 40 m
• The through-wire is fixed in the center of ZCT
• Voltage imbalance ratio: 3%

Inverter special measurement

A case is known where a motor is driven by setting the system voltage and inverter to the same frequency.
(Ex. System frequency: 60 Hz, inverter frequency: 60 Hz)
In the past, since it was not possible to remove the frequency component of the inverter in such a configuration, it was difficult to measure the insulation resistance.
In the inverter special measurement, the measurement of the insulation resistance is made possible by detecting the minute deviation in frequency. The 60 seconds required as the measurement time is the time for accumulation of the data necessary for this measurement.

Comprehensive Current Diagnosis Type Technical Data (Reference)

Use one CT per motor to detect current flowing into the motor. Select a CT that matches the motor capacity.

CT type	Measurement range	Maximum measurement range	Applicable motor (200 VAC)	Applicable motor (400 VAC)
K6CM-CICB005 5 A	1.00 A to 5.00 A	1.00 A to 5.25 A	0.75 kW	1.5 kW to 2.2 kW
K6CM-CICB025 25 A	5.00 A to 25.00 A	5.00 A to 26.25 A	1.5 kW to 5.5 kW	3.7 kW to 11 kW
K6CM-CICB100 100 A	20 A to 100 A	20 A to 105 A	7.5 kW to 22 kW	15 kW to 45 kW
K6CM-CICB200 200 A	40 A to 200 A	40 A to 210 A	30 kW to 45 kW	55 kW to 90 kW
K6CM-CICB400 400 A	80 A to 400 A	80 A to 420 A	55 kW to 90 kW	110 kW to 200 kW
K6CM-CICB600 600 A	120 A to 600 A	120 A to 630 A	110 kW to 150 kW	250 kW to 300 kW

Note: At no load, the motor current is at approximately half rated load.
Select a CT that can cover the range of 50% to 100% of rated current.

Use the following expression when calculating the current value from the motor capacitance.

$$\text{Current value of motor (A)} = \frac{\text{Motor capacitance (kW)} \times 1000}{\text{Motor voltage (V)} \times \sqrt{3} \times \text{Power factor (0.9)} \times \text{Efficiency (0.8)}}$$

(Example) When a 5.5-kW motor is used at 200 V

$$\text{Current value of motor} = \frac{5.5 \times 1000}{200 \times \sqrt{3} \times 0.9 \times 0.8} = 22 \text{ A}$$

Therefore, the CT K6CM-CICB025 in which 22 A is within the measurement range is selected.
The measurement range is within 20 and 100 A even in the case of K6CM-CICB100, which means that 22 A is within the range and this model can also be used. However, during selection, priority must be given to a CT having a small rated current value in order to realize more accurate measurement.

Note: In the expression shown above, general values must be used for the power factor and efficiency, and the load factor must be 100%. However, depending on the actual operating environment, the actual current value and measured value may be different. If the CT is used at a current value that is below the lower-limit value of the measurement range of the CT, the measurement error of the degradation level will increase. Therefore, if possible, measure the current during a steady-state operation with a clamp meter, etc., and select a CT corresponding to the current value.
The frequency characteristics of the CT are as indicated below.
K6CM-CICB005 5A
K6CM-CICB025 25A

K6CM-CICB100 100A

K6CM-CICB200 200A

K6CM-CICB400 400A

K6CM-CICB600 600A

Vibration & Temperature Type: Technical Data

Pairing of sensor head and pre-amplifier

The sensor head and the pre-amplifier are calibrated and inspected as a set at the factory shipment. Be sure to use them with the combination shipped. The sensor head cannot be replaced.

To verify the combination, check the serial numbers on the label of the sensor head and the label of the pre-amplifier. The same serial number means the correct combination.

If you change the combination of factory shipping conditions and then use them, the value of acceleration and the value of velocity will be inconsistent, so measurement cannot be correctly monitored.
The number following (21) in the second line is the serial number.
Make sure that this number on the sensor head's label matches the number on the pre-amplifier's label.

List of Parameters

Setting values

Parameter	Content	Model K6CM-VBM	Model K6CM-ISM	Model K6CM-CIM
Acceleration/upper-limit alarm threshold value (Critical and Warning)	0.00 to 99.99 G	●		
Velocity/upper-limit alarm threshold value (Critical and Warning)	0.00 to 99.99 mm/s	●		
Motor temperature/upper-limit alarm threshold value (Critical and Warning)	0 to 9999 deg.	●		
Temperature gap/upper-limit alarm threshold value (Critical and Warning)	0 to 9999 deg.	●		
Insulation resistance/lower-limit alarm threshold value (Critical and Warning)	0.000 to 9.999 MΩ		●	
Degradation level/lower-limit alarm threshold value (Critical and Warning)	0 to 999			●
Current/upper-limit alarm threshold value (Critical and Warning)	CT rating 5 A: 00.00 to 99.99 A CT rating 25 A/100 A/200 A/400 A/600 A: 0.0 to 999.9 A			●
Main unit IP address	Sets the IP address of the main unit. The default value is "192.168.250.10" (common to all models)	●	●	●
Software reset	Restarts the K6CM. Used to enable the settings after changing the setting values. 0 → 1: Execute	●	●	●
MAX/MIN reset	Initializes the MAX/MIN value. 0 → 1: Execute	●	●	●
Display value type	Sets which measurement value to display in the 7-segment display at the front of the main unit. 0: PV (Present Value), 1: MIN, 2: MAX	●	●	●
Trigger mode *1	Sets the trigger mode. 0: At all times, 1: External trigger, 2: Internal trigger	●	●	●
Trigger type	Sets Rise, Fall, or Level in the case of an internal trigger or external trigger. 0: Rise, 1: Fall, 2: Level	●	●	●
Trigger level	Sets the trigger level when "Internal trigger" and the trigger type "Level" have been selected.	●	●	●
Monitoring time	Sets the time for continuing measurement or monitoring in the case of an internal trigger or external trigger, when the trigger type is either Rise or Fall. Setting value: 0.1 to 600.0 s	●	●	●
Alarm latch	Sets whether to enable or disable the alarm latch function. 0: Disable (no latch), 1: Enable (latched)	●	●	●
Use Running Time	Sets whether or not to use the main unit residual amount function. 0: OFF (Do not use), 1: ON (Use)	●	●	●
Moving average times	Performs the averaging process for the past n-times of data including the sampling data of that time, each time sampling of the measurement value is performed. 0: OFF, 1: 2 times, 2: 4 times, 3: 8 times, 4: 16 times, 5: 32 times	●	●	●
Temperature unit	Sets the temperature unit. 0: °C, 1: °F	●		
Circuit topology	Sets the Circuit topology. 0: Three-phase, three-conductor, S-phase ground 1: Three-phase, four-conductor, N-phase ground, load-side △ connection		●	
Using inverter	Sets the Using inverter. 0: OFF (without inverter), 1: ON (with inverter)		●	
Inverter special measurement	Sets the inverter special measurement. 0: OFF, 1: ON (Refers to the special calculation performed when the inverter frequency and commercial frequency are close.)		●	
Current range	Selects the connected CT. 0: 5 A, 1: 25 A, 2: 100 A, 3: 200 A, 4: 400 A, 5: 600 A			●
Transistor output method *2	0: Normally Closed/1: Normally Open	●	●	●

*1. The external trigger function can be used only when the insulation resistance type is EIP CPU version 1.1 or higher.
*2. Can be used only with EIP CPU version 1.1 or higher.
